Introduction

The Geographical Information System for TEPB was designed for asset management, optimised planning, improved work progress monitoring and for better customer service. The GIS is used by management and staff to improve work achievements and quick response to customers.

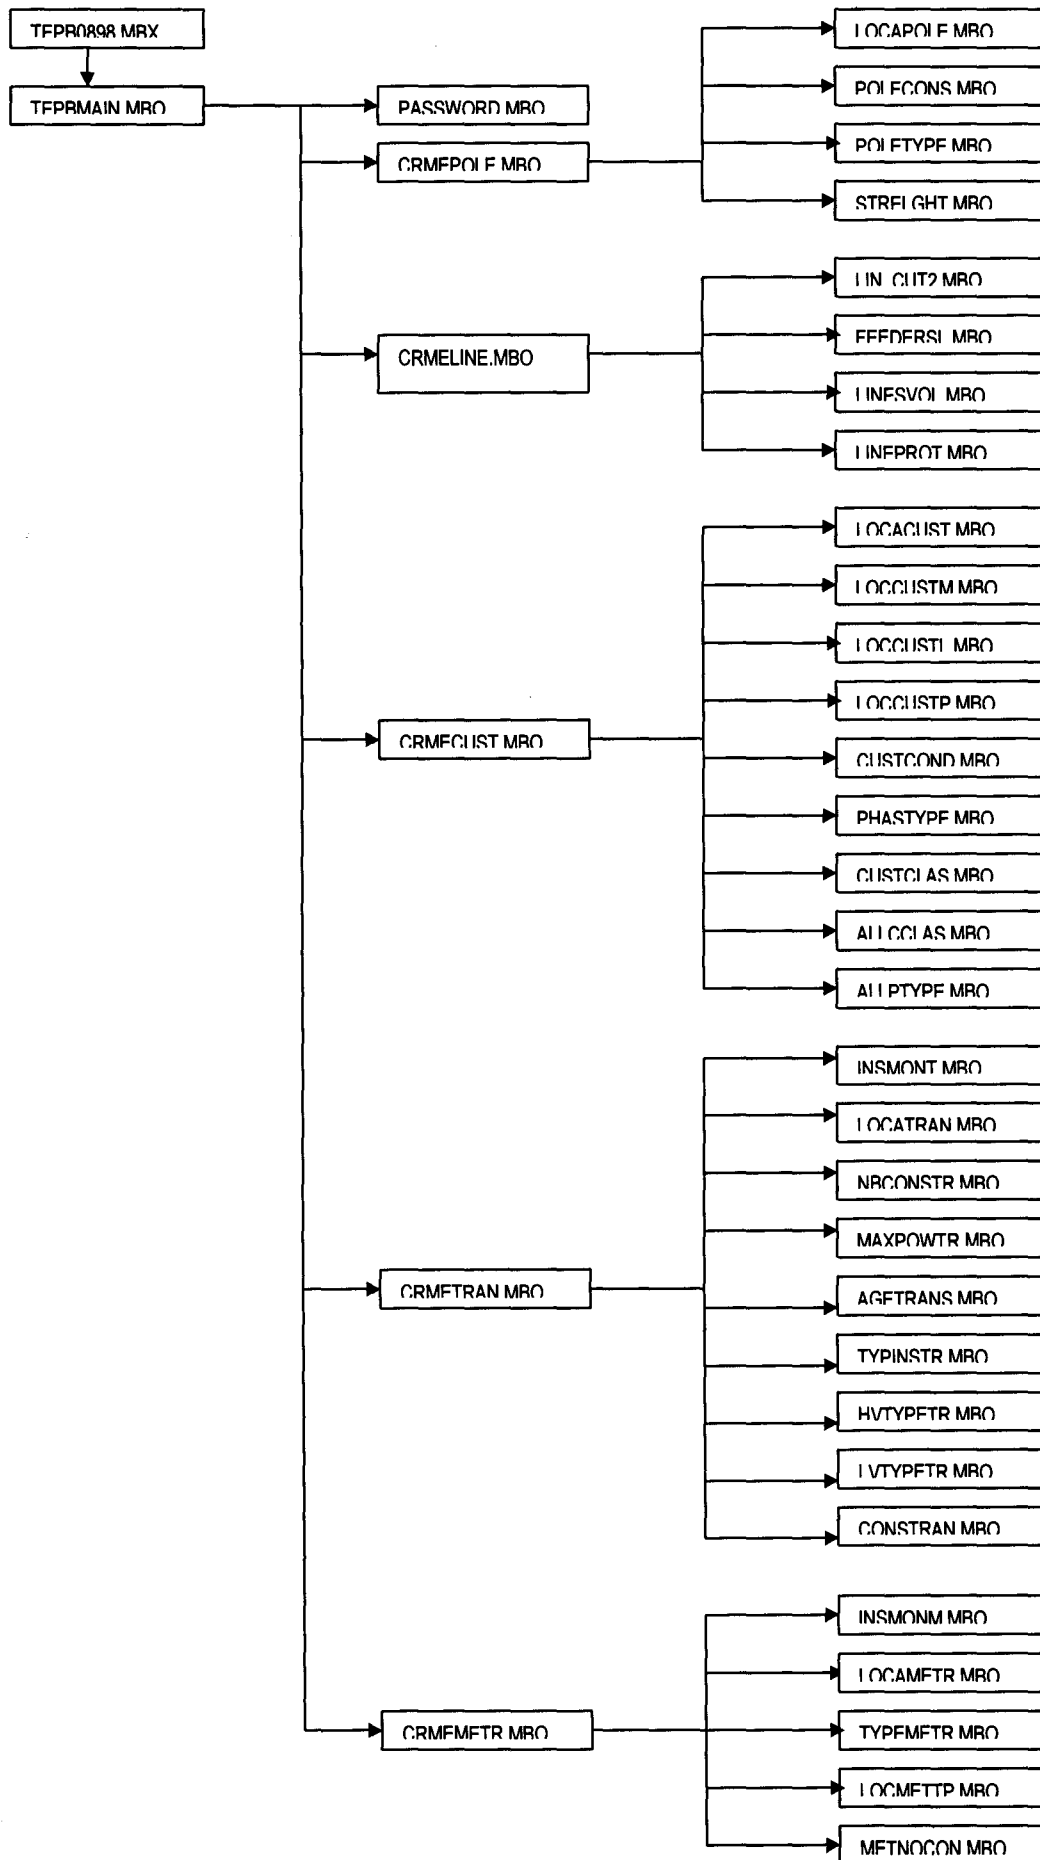

This program documentation has different chapters containing the:

- Structure of the program
- How to access information
- Documentation of the sup programs

This GIS programming manual does not replace the MapInfo or the MapBasic User's Guide or Reference Guide. It is designed to maintain and update the MapBasic add on to the normal MapInfo menu bar. The add on shortcuts the normal MapInfo queries and other procedures and allows a non GIS trained person to access spatial and non spatial information through just a click on a button.

The structure of the documentation allows permanent update whenever a program is added or modified. This will enable program understanding and maintenance merely by inexperienced users. This will also allow adapting parts of these programs to other utility e.g. Tonga Water Board.

Structure of Program

How to Access Information

TEPB Spatial database is object oriented. Thus enabling users to have access to any information through the objects:

- Poles
- Lines
- Customer
- Transformers

For any information requirement for purposes such as, asset management, planning, projects monitoring or customer service, the user will have to address one of the above mentioned objects. These objects have drop down menus that are added to the existing MapInfo Menu Bar.

Drop Down Menu – Poles

Currently the Drop down menu Poles contains four different programs.

Construction in Month...

This program allows the user to display all poles constructed in a particular month. The program asks the user to type in the year and the month. Then it displays all poles constructed during this month in red and all others in black. [PoleCons.MBO]

Locate a Pole

This program will enable the user to locate a pole by typing in the Pole number or Id. This information is required from the user by the program. Then the identified pole is centred and zoomed in on the screen. The identified pole is displayed in red, all others in black. Clicking on the Pole allows the user to access all information about this Pole, such as Pole type, Voltage, etc. [LocaPole.MBO]

Pole Condition

This program is not ready yet. It will later display the pole condition registered by the last GPS survey. During such surveys the teams will store information about the pole condition into the data dictionary of the GPS rover.

Defined Pole Type

For this program the operator has to select a pole type from a drop down list. Then the program displays all pole of this type in red and poles of all other type in black. [PoleType.MBO]

Street Lights

This program displays the poles with streetlights in different colours due to type of the mounted street light. All poles without street light it displays in black. [StreLght.MBO]

Last Survey

This program is not ready yet. When the GPS survey will take place regularly, this program will provide an overview which poles have been surveyed in which period.

Drop Down Menu – Lines

Currently the Drop down menu lines contains five different programs so far (Edwin will add a lot!).

Cut a Line

The program “cut a line” provides a scissors for the user. First the user has to zoom into the part of the map where he wants to simulate a line cut. Then he clicks on the scissors tool bar and afterwards on the point of cut on the line. The program shows the part of the line network, which is without electricity in red the rest in black.

[Lin_Cut2.MBO]

Selected Feeder

The program let the operator select a feeder by its name from a drop down list. Then the program shows this particular feeder in red whereas the other feeders are displayed in black. [FeedersL.MBO]

Voltage Type

This program displays all lines in different colours according to their voltage. Note: the upper table information is displayed, there may be two or more lines on one pole and the top GIS layer is displayed! [LinesVol.MBO]

Consumption by Line

This program is not ready yet. It will display the calculated consumption on the line.

Drop Down Menu – Customer

The drop down menu customer provides the access to programs related to customers and meters. [CrMeCust.MBO]

Customer Connection in Month...

This program allows monitoring the progress of work in TEPB. After typing in the month and year the program displays all customer connected during this particular period in red and the rest in black. [CustCond.MBO]

Customer Identification by Meter Number

This program asks the operator for typing in the meter number and then display the corresponding customer. The display centralises the particular customer in red and zooms in at the same time. [LocCustM.MBO]

Customer Identification by Account Number

This program asks the operator for typing in the account number and then display the corresponding customer. The display centralises the particular customer in red and zooms in at the same time. [LocaCust.MBO]

Customer Identification by Location Number

This program asks the operator for typing in the location number and then display the corresponding customer. The display centralises the particular customer in red and zooms in at the same time. [LocCustL.MBO]

Customer Identification by Pole Number

This program asks the operator for typing in the number of the next pole and then display the corresponding customer. The display centralises the particular customer in red and zooms in at the same time. [LocCustP.MBO]

Phase Type

The program let the operator select a phase type. Then the program shows all customers connected to this corresponding phase in red whereas the other customers are displayed in black. [PhasType.MBO]

All Phase Types

This program displays all customers due to their connected phase type in different colours. [AllPType.MBO]

Customer with and without Pole Fuse

The program is not ready yet. The program will displays the customers connected without pole fuse in black and the ones connected with pole fuse in red.

Customer Consumption

Program not ready yet

Customer Consumption 10% higher than Average

Program not ready yet

Customer Consumption 10% lower than Average

Program not ready yet

All Customers grouped by Class

The program displays all customers grouped according to following customer types:

- Domestic
- Commercial
- Church
- Hotel
- Industrial

[AllCclas.MBO]

Selected Customer Class

The program asks the operator (Paula) for selecting a customer class. Then it displays the selected customer group in red and all other customers in black. [CustClas.MBO]

Drop Down Menu – Transformers

The drop down menu transformers provides the access to programs related to load management, transformer monitoring etc. The drop down menu allows the access to nine different programs so far.

Installation Month

The program installation month allows the user to display all transformers installed in a particular month. The program asks the user to type in the year and the month. Then it displays all transformers installed during this month in red and all others in black. [InsMonT.MBO]

Locate Transformers

This program will enable the user to locate a transformer by typing in the transformer location number. Then it centres the identified transformer and zooms in. The identified transformer is displayed in red, all others in black. Clicking on the transformer allows the user to access all information about this transformer, such as transformer type, voltage, load, etc. [LocaTran.MBO]

Display KVA Groupings

The program displays all transformers grouped according to following KVA ranges:

- 1 - 15
- 15 - 30
- 30 - 50
- 50 - 100
- 100 - 200
- 200 - 500
- 500 - 1000

[MaxPowTr.MBO]

Display Transformer Age

This program displays all transformers in different colour according to their age. The grouping is according to the year of manufacturing.

- 1951:1960
- 1961:1971
- 1971:1981
- 1981:1986
- 1986:1991
- 1991:1996
- 1996:2001

[AgeTrans.MBO]

Display on Pole, Pad or in Stock

This program displays all transformers in different colours according to their mounting. A transformer can be mounted on pole (normal) or on pad. It is also possible that the transformer has been taken to stock. [TypInsTr.MBO]

High Voltage Type

This program categorises and displays in different colours the transformers according to their high voltage type:

- 11 kV
- 6.6 kV
- 11 kV and 6.6 kV

[HVTypeTr.MBO]

Low Voltage Type

This program categorises and displays in different colours the transformers according to the voltage they proudly distribute:

- 240
- 415
- 433
- 415/240
- 480/240

[LVTypeTr.MBO]

Transformer Consumption

The program displays the calculated consumption (kWh) of customers connected to the installed transformers in automatic ranges. [ConsTran.MBO]

Cost of Power Failure

This program estimates the cost of power failure by calculating:
the time of power cut,
number of distributing transformers affected,
number of customers connected to the transformers,
the average consumption.

[NbConsTr.MBO]

Drop Down Menu – Meters

The drop down menu meters provides the access to programs related to meter installation, type, maintenance, etc. The drop down menu allows the access to five different programs.

Connection Month

The program connection month displays all meters installed in a particular month. The program asks the user to type in the year and the month. Then it displays all customers which meters have been installed during this month in red and all others in black. [InsMonM.MBO]

Locate Meter Number

This program enables the user to locate a meter by typing in the meter number. It centres the identified meter and zooms in. The identified meter is displayed in red, all others in black. Clicking on the meter allows the user to access all information about this meter and the connected customer, such as customer consumption, customer class, meter type, etc. [LocaMetr.MBO]

Display Meter Type

This program displays all meter according to their type in different colours. It ranges all approximately 60 meter types in 10 categories. The operator then has to go into the table Meter to access further details. [TypeMetr.MBO]

Locate Meter Type

This program allows the user to select from a drop down list the exact meter type. Then the program displays all meters of this type in red and all others in black. [LocMetTp.MBO]

Meter Removed

This program displays the current social situation. All meters disconnected are displayed in red, this mirrors people in dire straits. However, this also mirrors people unwilling to pay their bill or mucking around with this costly instrument in order to manipulate in a dirty way. [MetNoCon.MBO]

Program Documentation

This chapter contains the source code of all programs in use. This source code can be copied and paste into MapBasic editor to recover lost or corrupted programs.
